New FUJIFILM ASK Digital Photo Print Systems

The affordable way to produce lab quality prints in seconds

Ideal for law enforcement and government applications, FUJIFILM's ASK Digital Photo Print Systems can output a 4x6 print in 8 seconds, or an 8x10 print in just 40 seconds. FUJIFILM's proprietary Image Intelligence™ software optimizes every image, even those taken in sub-optimal conditions. The ASK Print Systems use a dye-sublimation process to produce lab quality digital photos in an environmentally friendly way. Consumables include dye-sublimation ribbon and paper; there is no need to purchase and store photo-processing chemicals or worry about light sensitive materials. Ribbon and paper replacement is easy and the printer's small footprint makes it easy to operate on any counter or desktop with a Windows 2000 or XP PC.

Outstanding Image Quality with Image Intelligence™

ASK Digital Photo Print Systems use Image Intelligence™, FUJIFILM's acclaimed image enhancing software. Image Intelligence uses sophisticated image algorithms to read every single frame as it is being processed and automatically optimizes the print of every image. As a result, there is no need to adjust image quality. Image Intelligence automatically eliminates scratches and dust particles and compensates for many of the problems inherent in crime scene photography: poor photographic conditions, backlighting and underexposure. Even when photos were shot under less-than-optimum conditions, Image Intelligence ensures high image quality.
